Ordering Information

#### Introduction

EGC-250 is a MANUAL Generator controller module including protection for standby power supply (Generator/ DG Set). It uses single advanced micro controller chip for an easy and trouble free DG control. It is cost effective solution for DG operation. User can start the DG manually or automatically using remote mode operation. User can control DG or Mains breaker using front keys or DI. In any faulty condition it raise alarm. All the alarm occurring at abnormal DG conditions are detected and displayed on LCD and if necessary DG is stopped and hooter gets activated.

#### **Features**

- ❖ Display of 3 Phase Generator Parameters: Voltage, Frequency, Speed, Run Hours
- Measurement and display of Load current and Instantaneous load in kW
- Metering Energy for DG.
- Wide range of Programmable Parameters including settings of voltage, frequency, different delay times
- Wide range of Analog Sensor Selection
- All DI/DOs are programable
- Fixed combined input-output charge alternator port with short circuit protection
- Fault records with date and time stamp
- Event records with date and time stamp
- Logical interlock for Mains & DG breaker for fail safe operation
- ❖ Wide array of time circuits for start delay, stop delay, re- cooling etc
- Full engine safety functions: The unit has Low Lube Oil Pressure (LLOP), Hi Coolant Temperature (HCT), Over speed, Start Failure, Stop Failure, Fuel level trip, Emergency stop and Overload trip functions

#### **Hardware**

- 3 Analog inputs
- 5 Digital inputs
- 6 Potential outputs for operating external relays
- Charge Alternator Input / Output
- MODBUS/GSM/USB communication (optional)

#### **DG Protection**

- Under/Over Voltage & Frequency protection
- Overload protection with selectable Over load setting
- Internal interlock for EB (Mains) & DG CB (Circuit Breaker) for Fail Safe Operation
- Manual circuit breaker options
- Wide array of time circuits for Start delay, Stop delay, Re- cooling, Cranks etc
- DG Faults like Fail to start, Fail to stop & Low battery
- Protection against Engine faults like LLOP, HCT, Low Fuel & Over speed etc
- Programmable Timers
- All DI/DOs are programmable
- Wide range of analog sensor selection
- Fuel Engine Safety Functions
- Maximum Fail Safe Protections like RWL, Charge Alternator, Canopy Temperature, Air Cleaner Blockage & Emergency Stop

#### **Operating Modes**

EGC-250 operates in one of the three modes as described below. The operating mode can be selected from parameters settings.

The Three modes are:

- (a) Manual Mode
- (b) Remote Mode
- (c) Installation Mode

#### **Manual Mode**

This mode is selectable from parameter settings. In this mode EGC-250 will be operated manually. It will only respond to START and STOP keys or manual START, STOP DI for Generator start and stop operation. These keys will be functional only when manual mode is active. Generator and Mains CBs will not be operated automatically. User can open or close CBs using from breaker keys. Start key should be pressed until the engine reaches the threshold speed. Generator CB may now be closed provided that the Mains CB is open. Pressing of Stop key turns off the engine. Before giving stop command from keypad, the generator CB must be open. The generator is stopped without going thru recooling phase. In this mode all protection for Gen Set like under voltage, over voltage, HCT, LLOP etc. will remain active.

#### **Remote Mode**

This mode can be selected from parameter setting. It will only respond to Remote Start DI signal and Remote Stop DI signal for DG start and stop operation. Generator and Mains CBs will be operated externally through DI without automatic control of EGC-250. Before giving start command to Generator one must ensure that Generator CB is open. Remote Start DI signal should be held down until the engine reaches the threshold speed. Generator CB may now be closed provided that the Mains CB is open. Remote Stop DI signal turns off the engine. Before giving stop command from DI, the generator CB must be open. The generator is stopped without going thru recooling phase. In this mode all protection for GEN-SET like under voltage, over voltage, HCT, LLOP etc. will remain active.

#### **Installation Mode**

This mode is selectable from parameter settings. This mode is to check connections only at time of installation or servicing. User can see the current status of DI-DOs. User can also operate or DOs or can toggle the state of each DOs irrespective of any conditions or internal interlocking of MCB and GCB. User need to be very careful and must be aware of the operation of the controller and connections, to avoid mis happening. In this mode all protections are off, control switches are inactive. But in this mode metering works as any other operating mode. Parameter will not be save for DI, DO settings etc.

Note: User must ensure interlocking of Mains and Generator CB during Installation Mode of EGC-250.

#### Fault & Event Recording

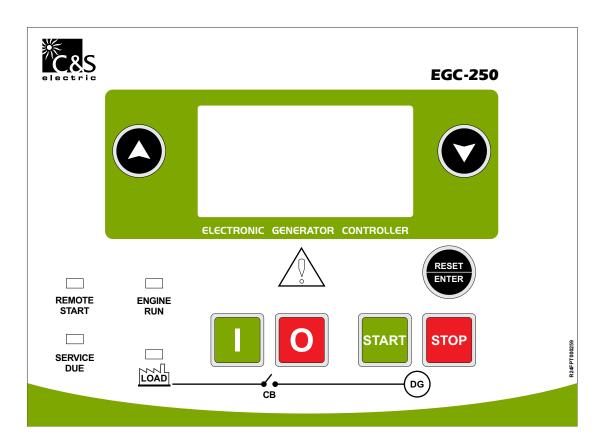

EGC-250 records faults & events in its non volatile memory with date and time stamp. Fault indicator helps the user to identify clearly the fault and to monitor relay setting and operation. Latest fault/event will be the 1st one.

## **Human Machine Interface**

For fault annunciation, setting parameters and other DG operations & local access It comprises of:

- Three switches for editing and viewing of parameters.
- Two switches for breaker control. MCB and GCB both can be operated depending on the availability of DG voltage
- Two switches for DG Start & Stop.
- ❖ 5 LED's are for Supply status, DG status and Fault or Warning annunciation see figure given below:

Keys	Description
٥	Scrolling up/Increment key
0	Scrolling down/Decrement key
START	DG START key [manual mode only]
STOP	DG STOP key
RESET	ENTER key & Fault RESET key (Long Press for 2 Sec.)
0	Breaker Open Control
1	Breaker Close Control [manual mode only]

## **Output Contacts**

No. of Potential outputs : 6 (Six)

Type of outputs : Potential

## **Input Contacts**

No. of Digital inputs : 5 (Five)
No. of Analog inputs : 3 (Three)

Programmable (DI / DO) : Yes

Advanced Charge Alternator Contact : Yes

<sup>\*</sup> If input signal is negative (shorted to Batt -ve) it raise alarm and stop the DG

## **Technical Data**

## (a) Performance Specification

S.No	Parameter	Specification
1	Aux. supply	7-35V DC
2	Aux. supply Interruption Time	Half second sustains battery dip down to zero volts without requiring external capacitor bank.
3	Aux. supply burden	<1.0W @24V DC
4	Generator voltage	P-N: 300V AC, P-P: 600V AC [Max]
5	Rated frequency	50 / 60 Hz
6		Rated secondary current5A
7	Secondary current measurement	0.1 - 7A
8	Battery voltage supervision	6.0 - 35.0V (DC)

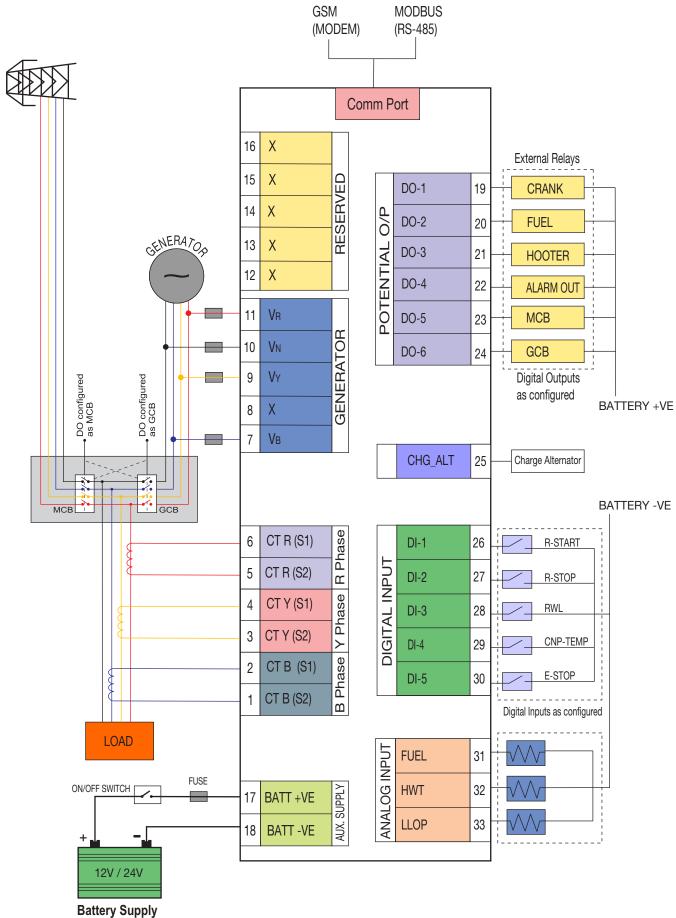

## (b) Measurement Accuracy

S.No	Parameter	Specification
1	Voltage measuring tolerance	<u>+</u> 1%
2	Freq. measuring tolerance	<u>+</u> 1%
3	Tolerance of VBatt measurement	<u>+</u> 2%
4	Current measurement tolerance	± 2%
5	Energy measurement tolerance	± 2%

<sup>\*\*</sup> Depends upon the user configuration.

33	LLOP	Low Lube Oil Pressure	Analog Sensor Input <sup>*</sup>	

<sup>\*</sup> can be used as digital input also

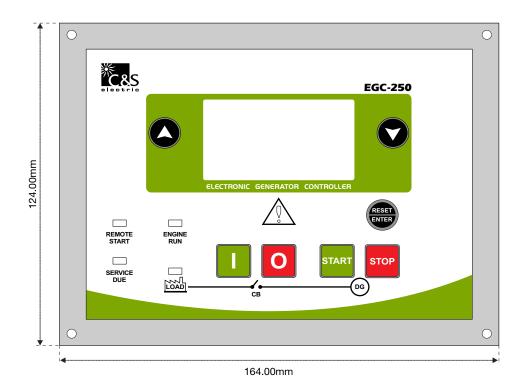

#### SPECIAL NOTE:

- DG Body (Battery-Ve) should be earthed properly.
- Use separate+Ve & -Ve supply from DG battery terminal for EGC-250. Do not Loop this wires to any other wires in side the control panel.
- Use RC snubber networks across contactor coil.
- Use RC filter across Start & Stop relay contacts.
- Use seperate trays for AC & DC wirings.
- Please make sure that all above conditions are fulfilled properly for trouble free operations of the EGC-250.
- Put free wheeling diodes across relay coil in external relay card.
